Quandong (Jack) Qian

Dallas, TX · +1 (832) 888-6016 · jack@aimanjack.com · linkedin.com/in/quandong-qian-156563191 · github.com/qianquandong · realagentusecases.com/jack · US Permanent Resident (no sponsorship needed)

Target: AI Forward Deployed Engineer / Solutions Engineer — enterprise workflow automation with human review and explicit failure boundaries.

EXPERIENCE

Business Planner, Supply Chain — Texas Instruments, Dallas, TX — Apr 2026 – Present

- Automated recurring scheduling, order-correction, and reconciliation work (~5 hours/week of manual checking); reports and tools now used daily by planners across 13 groups, with their feedback driving each iteration.
- Scripted SAP GUI with Python (win32com): sales-order scheduling, corrections, and release run end to end in an isolated session, dry-run by default, never touching the live user session.
- Built Selenium form-fillers for 12+ internal approval and request types; each form is left open for human review — nothing auto-submits.
- Replaced manual SAP / Spotfire / Excel cross-referencing with direct SQL against a data-virtualization layer: supply-gap portfolio reports, a scheduled weekly risk email, and quarterly review decks generated straight from data.
- Founded a 300-member internal AI community; present these automation playbooks every two weeks.

Industrial Engineer — Texas Instruments — Aug 2023 – Apr 2026

- Led constraint-aware scheduling logic capturing load-port and expression-based limits earlier logic ignored, improving dispatch accuracy.
- Modified MES message structures and reports for integrated load/unload functionality; resolved data mapping across 4,802 variations.
- Authored real-time dispatching rules balancing throughput, cost, cycle time, and on-time delivery.
- Automated the daily dispatch-metrics email, reticle-delivery ETL analysis, and file-version checks and dispatch-job migration across redundant servers.

Application Engineer, IT — Texas Instruments — Jul 2022 – Aug 2023

- Ran and maintained the real-time dispatching (RTD) servers behind TI's global fabs: upgrades, automated restarts, security validation, monitoring, and a server-health dashboard.
- Worked on high availability for real-time dispatching — a fully automated fab stops when dispatch stops (~$4M/hour); with HA, production keeps running through server upgrades.

Founder & Lead Organizer — Dallas Chinese AI Community · Real Agent Use Cases (side project) — 2026 – Present

- Founded Dallas's first Chinese AI community and grew it to 700+ members; 5 live events Apr–Aug 2026, 246 cumulative attendees, 70 at the largest.
- Designed and taught Agent 101, a bilingual course and hands-on workshop where nontechnical attendees build a working Gmail agent live from a template.

SELECTED PROJECTS

- **AI SMS support agent (live)** — Cloudflare Worker + OpenAI function calling + D1, Twilio as a pure pipe; answers questions, checks availability, and books appointments in English, Chinese, and Spanish. One write path to the database (booking after the user confirms a slot); refuses out-of-scope requests and never takes payment by SMS.
- **Open-source agent workflows** — real-agent-workflows (Obsidian content OS, 6 workflows), track-ai-visibility, booking-research-agent, cheap-flights; all with human gates on send/publish actions (github.com/qianquandong).
- **realagentusecases.com** — bilingual content and course site; Next.js static export on Cloudflare Workers with automated publishing gates.

EDUCATION

B.S. Electrical Engineering, Minor in Mathematics — Texas A&M University, College Station, TX — May 2022

SKILLS

- Python, SQL, Selenium, SAP GUI scripting (win32com), shell scripting, ETL, Cloudflare Workers / D1, Next.js
- OpenAI / Claude APIs, function calling, agent and workflow design (dry-run defaults, human-in-the-loop gates, failure boundaries)
- Languages: English, Mandarin Chinese (bilingual teaching and delivery)
